Criteria	Excellent (4)	Proficient (3)	Developing (2)	Unacceptable (1)
Fact Base Quantity & Depth	Contains more than 100 facts that are highly accurate, meaningful, and well-structured.	Contains 75–100 facts, or a few facts contain logical inconsistencies.	Contains 50–74 facts, or facts are highly repetitive with minimal depth.	Contains fewer than 50 facts or the fact base is completely broken.
Rule Base Complexity	Implements 15 or more unique rules showcasing advanced logic (e.g., recursion, cuts, or complex changing)	Implements 15 rules, but some are trivial wrappers	Implements 10–14 rules, or rules contain frequent logical errors.	Implements fewer than 10 rules or rules fail to execute.
Test Queries & Validation	Provides 10 comprehensive test queries with expected outputs, covering edge cases and complex rule paths.	Provides 10 test queries, but they only test basic facts rather than complex rules	Provides 5–9 test queries, or queries return errors instead of valid results.	Provides fewer than 5 test queries or test cases are documented.
Program Correctness & Logic	The program compiles perfectly and runs without unexpected failures, infinite loops, or singleton variables.	The program compiles, but contains minor logical errors or few unresolved singleton variables warnings.	The program has significant bugs, frequently enters infinite loops, or returns incorrect logic.	The program fails to compile or does not execute any valid queries.
Code Documentation & Presentation	Code is exceptionally clean, properly indented, and includes detailed comments explaining rule logic and predicates. Documentation is complete and organized.	Code is readable and contains comments, but lacks explanations for complex recursive rules. Documentation is not organized as per outline.	Code is messy, lacks proper indentation, and provides minimal or vague comments. Documentation is lacking of 1 part.	Code contains no comments or is completely unreadable. Documentation is lacking of 2 or more parts.
